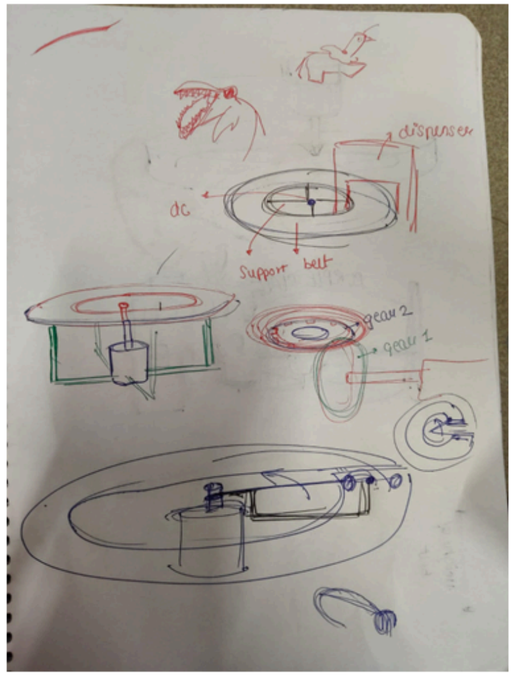
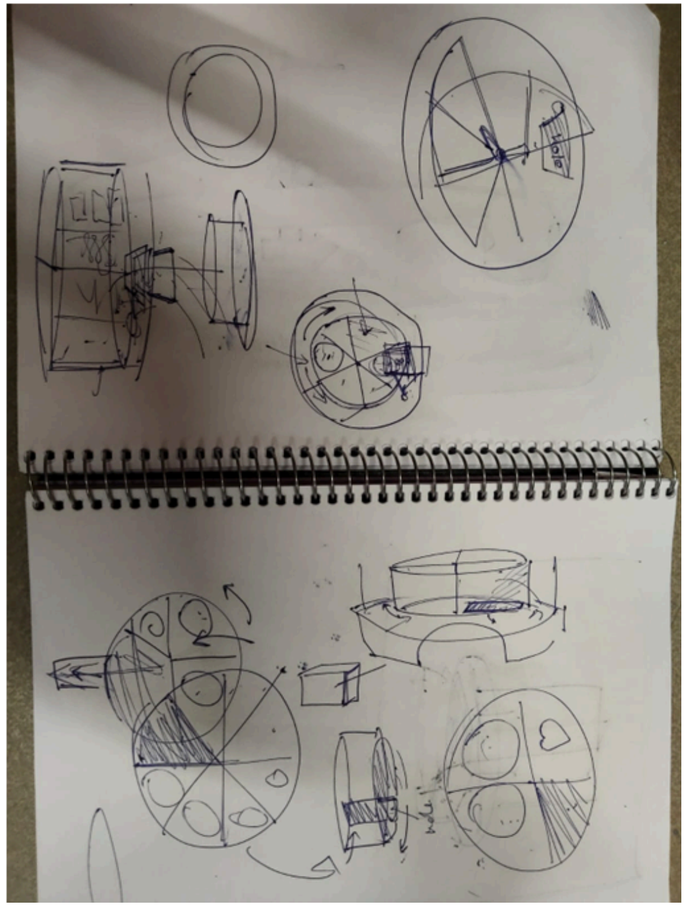
DC motor
box for
breadboard.



dispenser
DC
support
belt
gear 2
gear 1



Initial idea was to create a customizable cake machine

Second we went for just flavour opts

Later the switch to flavoured candies

Fabrication and Integration

Cardboard and MDF were used as the main materials for the project. Cardboard was chosen because it is lightweight, easy to cut, and quick to work with during prototyping. It allowed fast changes and adjustments in the design without much effort. MDF was used for parts that needed more strength and stability, such as the base and support structures. It provides a firm surface and holds components like motors more securely. The house and isspnecer is made up of cardboared even the wheel is made of cardboard.The the base of the wheel, the support for dc,neopixel,breadboard and buttons are made out of mdf, Also we have used ALUMINIUM FOIL and newspaper for the stand.
